
EXCHANGE SETUP & PLACING YOUR FIRST TRADE

A Step-by-Step Beginner's Guide to Bybit (and BloFin for Restricted Countries)

By Josh • @bitcoin.daily • Bitcoin Daily VIP

"Knowing the signal is only half of it. You need to be able to execute it quickly and correctly the moment it drops."

This guide walks you through everything from creating your account to placing a live trade with a proper entry, stop loss, and take profit — exactly as you would when following a Bitcoin Daily signal. Read this once, follow the steps, and you'll never be fumbling with your exchange when a signal fires.

■ ■ *Disclaimer: Nothing here is financial advice. Exchange availability varies by country. Always verify your local regulations before trading on leveraged products.*

SECTION 1

Which Exchange Do You Use?

There are two exchanges recommended by Bitcoin Daily depending on where you live. The majority of members use **Bybit**. If Bybit is not available in your country (such as the US), use **BloFin**.

	BYBIT	BLOFIN
Best for	Most countries worldwide	US & other Bybit-restricted regions
Also used for	Prop firm / funded account trading	Spot & derivatives trading
Sign up	partner.bybit.com/b/bitcoindaily	partner.blofin.com/d/BitcoinDaily
Bonus	Up to \$30,000 in bonuses	Up to \$1,000 in bonuses

Not sure if Bybit is available in your country? Check the Bybit website or ask in the Discord — the community will point you in the right direction. **Always use the Bitcoin Daily referral links above** — they unlock the best bonus tiers and support the community.

SECTION 2

Setting Up Bybit — Step by Step

BYBIT

1 Create Your Account

Go to partner.bybit.com/b/bitcoindaily and click **Sign Up**. Use your email address. Choose a strong password and save it somewhere secure.

- Use the Bitcoin Daily referral link to unlock the full bonus tier.

2 Verify Your Identity (KYC)

Bybit requires identity verification to withdraw funds and access full trading limits. Go to **Account > Verification** and complete the KYC process. You'll need a government-issued ID and a selfie. This usually takes 5–30 minutes.

- Complete KYC before depositing — it saves time later.

3 Enable Two-Factor Authentication (2FA)

Go to **Account > Security** and enable 2FA using an authenticator app (Google Authenticator or Authy). This protects your account from unauthorized access. **Do not skip this step.**

4 Deposit Funds

Go to **Assets > Deposit**. You can deposit crypto directly (USDT on TRC-20 is the most common and cheapest) or buy crypto with a card. For most members, depositing USDT is the fastest route.

- Start with only what you're comfortable risking. Never deposit more than you can afford to lose.

5 Transfer to Your Derivatives Wallet

Once funds arrive, go to **Assets > Transfer** and move USDT from your **Funding Wallet** to your **Unified Trading Account (UTA)**. This is where you'll trade from.

6 Navigate to the Trading Interface

Click **Trade** in the top navigation, then select **Derivatives > USDT Perpetual**. Search for the asset from the signal (e.g. SOLUSDT, BTCUSDT). You'll land on the trading chart.

SECTION 3

Placing a Trade on Bybit

BYBIT

We'll use the example SOL Short signal from the signals guide: Entry \$85.30, Stop \$86.04, TP1 \$84.00, Risk 0.5%, Leverage 5–10x.

1 Set Your Leverage

On the trading screen, find the **leverage button** (usually shows '10x' or similar). Click it and set leverage to the signal's recommendation — for this SOL signal, set **5x to 10x**. Cross margin or isolated margin: **always use Isolated Margin** as a beginner. This limits your maximum loss to what's in that specific trade.

2 Select Order Type: Limit Order

In the order panel on the right, select **Limit** (not Market). A limit order fills at your exact price or better. For a SHORT, click the **Sell/Short** tab.

- Market orders fill instantly but at a slightly worse price — use Limit when you can.

3 Enter Your Position Size

Enter the quantity calculated from your position sizing formula. For a \$10,000 account at 0.5% risk with a \$0.74 stop distance: 67.5 SOL. Enter **67.5** in the quantity field (or the equivalent dollar value).

- Always calculate your size first using the formula — never guess.

4 Set Your Entry Price

In the **Price** field, enter the signal's entry: **85.30**. Your order will sit open until price reaches this level and fills.

5 Add Stop Loss & Take Profit (TP/SL)

Click **TP/SL** before confirming the order. Two fields will appear:

- **Stop Loss:** enter **86.04** (above entry on a short)
- **Take Profit:** enter **84.00** (TP1 — full exit for beginners)

Stop Loss trigger: Mark Price — protects against wick-based false stops. **Take Profit trigger: Last Price** — ensures your TP fills at the actual traded price.

6 Confirm and Place the Order

Review everything one final time before clicking **Sell/Short**. Check: entry price, quantity, stop loss, take profit, leverage, isolated margin. Once confirmed, your order appears under **Open Orders**. When it fills, it moves to **Positions**.

7 Monitor and Close

You don't need to watch the trade every second — your stop and TP are set. If TP1 hits, the position closes automatically. If your stop is hit, the position closes automatically at your pre-defined loss. Log the trade in TradrX when it closes.

Log every trade: tradrx.io

SECTION 4

Setting Up BloFin (Restricted Countries)

BLOFIN

If Bybit is unavailable in your country, BloFin is the recommended alternative. The process is nearly identical — the interface and order placement work the same way. Here's the BloFin-specific setup flow.

1 Create Your Account

Go to partner.blofin.com/d/BitcoinDaily and click **Sign Up**. Register with your email and set a strong password.

- Use the Bitcoin Daily referral link to claim your welcome bonus.

2 Complete Identity Verification (KYC)

Navigate to **Profile > Verification** and submit your government ID. BloFin's KYC process is similar to Bybit and typically clears within 30 minutes.

3 Enable 2FA Security

Go to **Profile > Security** and link an authenticator app. This is required before withdrawals and strongly recommended before any trading.

4 Deposit USDT

Go to **Assets > Deposit**. USDT on TRC-20 or ERC-20 are both accepted. TRC-20 has lower network fees. Confirm the deposit address carefully before sending.

5 Navigate to Futures Trading

Click **Trade > Futures** and search for your asset (e.g. SOL-USDT). The layout is similar to Bybit — chart on the left, order panel on the right.

6 Place Your Trade

The order placement process on BloFin is the same as Bybit: set leverage (Isolated), choose Limit order, enter quantity, set entry price, add Stop Loss and Take Profit, then confirm. Follow the same steps as

Section 3 above.

SECTION 5

Key Settings Every Beginner Must Know

Setting	What to Use	Why
Margin Mode	Isolated (always)	Caps your max loss at that trade's margin only
Order Type	Limit (preferred)	Fills at your price, not the market's price
TP/SL Trigger	SL = Mark Price / TP = Last Price	Mark Price stops prevent wick fakeouts; Last Price TP fills at real trade
Leverage	Follow signal's range	Never go above what the signal specifies
Position Mode	One-Way Mode	Simpler for beginners — one position per asset

Common Beginner Mistakes on the Exchange

- **Using Cross Margin instead of Isolated.** Cross margin uses your entire account balance as collateral — one bad trade can wipe everything. Always use Isolated.
- **Forgetting to set the Stop Loss before confirming.** Once you're in the trade without a stop, you're exposed. Set TP/SL at the same time as the order.
- **Using Market Orders at peak volatility.** Market orders during fast moves can fill \$10–\$50+ away from what you expected. Use Limit Orders.
- **Setting the wrong direction.** On a SHORT signal, you click Sell/Short — not Buy/Long. Double-check direction before every order.
- **Not switching to Isolated Margin.** Many exchanges default to Cross. Check before every trade — make it a habit.
- **Closing the position manually instead of letting TP/SL work.** If your TP and SL are set correctly, you don't need to babysit the trade. Let the system do its job.

Pre-Trade Exchange Checklist

- I am on the correct asset (e.g. SOLUSD, not SOLBTC)
- Margin mode is set to ISOLATED
- Leverage is set to the signal's recommended range
- I am on the correct side: SELL/SHORT or BUY/LONG
- Order type is set to LIMIT
- Entry price is entered correctly
- Quantity is calculated using my position sizing formula — not guessed
- Stop Loss is entered in the TP/SL field (not after the fact)
- Take Profit (TP1) is entered in the TP/SL field
- Stop Loss trigger set to Mark Price; Take Profit trigger set to Last Price
- I have reviewed all fields before clicking confirm
- I will log this trade in TradrX when it closes: tradrx.io

"Set it up correctly once. Then let the trade do its job."
